A power pylon has 33kV passing through a low resistance wire of 6kΩ. The wire is 149m long and reaches a temperature of 32°C. Calculate the power lost in the wires during transmission.

$$V = 33kV = 33,000V$$

$$R = 6k\Omega = 6000\Omega$$

$$P = P$$

$$V = I \times R$$

$$V / R = I$$

$$33,000 / 6,000 = I$$

$$5.5A = I$$

$$P = I^2 \times R$$

$$P = 5.5^2 \times 6000$$

$$P = 181,500W$$

$$\underline{181.5} \text{ kW}$$

Pylons are 95% efficient. How much time would it take to transfer 1.5MJ

$$P = 3,448.5kW = 3,448,500W$$

$$E = 1.5Mj = 1,500,000 J$$

$$t = t$$

$$P = E / t$$

$$t = E / P$$

$$t = 1,500,000 / 3,448,500$$

$$T = 0.43s$$

$$\underline{0.43} \text{ s}$$

A toaster needs 64.12kJ to toast bread. It is plugged into the mains, and the heating element has a resistance of 0.076kΩ. How much time would it take to toast a slice of bread.

$$E = 64.12\text{kJ} = 64,120\text{J}$$

$$V = 230\text{V}$$

$$R = 0.076\text{k}\Omega = 76\Omega$$

$$t = t$$

$$I = 3.02\text{A}$$

$$V = I \times R$$

$$V / R = I$$

$$230 / 76 = I$$

$$3.02\text{A} = I$$

$$E = V \times I \times t$$

$$E / (V \times I) = t$$

$$64120 / (230 \times 3.02) = t$$

$$92.31\text{s} = t$$

$$92.31 / 60 = 1.53 \text{ min}$$

1.53 min

On Planet Steve, an object has 2.6MJ of KE was dropped from 1.3km. Calculate the mass of the object.

$$KE / GPE = 2.6\text{MJ} = 2,600,000\text{J}$$

$$\Delta h = 1.3\text{km} = 1300\text{m}$$

$$F \text{ or } g = 2000\text{N (N/Kg)}$$

$$E = F \times d$$

$$E / d = F$$

$$2,600,000 / 1300 = F$$

$$2000\text{N} = F$$

$$GPE = m \times g \times \Delta h$$

$$GPE / (g \times \Delta h) = m$$

$$2,600,000 / (2000 \times 1300) = m$$

$$1\text{Kg} = m$$

1 Kg

A Generator has an efficiency of 32% and produces 1.8kJ/s. What is the total amount of energy being transferred to the generator?

$$\begin{aligned} \text{Eff.} &= 0.32 \\ \text{Use.} &= 1.8\text{kJ/s} = 1800\text{W} \\ \text{Tot.} &= \text{Tot.} \end{aligned}$$

$$\begin{aligned} \text{Eff.} &= \text{Use.} / \text{Tot.} \\ \text{Tot.} &= \text{Use.} / \text{Eff.} \\ \text{Tot.} &= 1800 / 0.32 \\ \text{Tot.} &= 5625\text{W or } 5625\text{J /s} \end{aligned}$$

5625 J

14% of the energy from the water is transferred in turbines. Deduce how much energy is in the flowing stream.

$$\begin{aligned} \text{Eff.} &= 0.14 \\ \text{Use.} &= 5625\text{J} \\ \text{Tot.} &= \text{Tot.} \end{aligned}$$

$$\begin{aligned} \text{Eff.} &= \text{Use.} / \text{Tot.} \\ \text{Tot.} &= \text{Use.} / \text{Eff.} \\ \text{Tot.} &= 5625 / 0.14 \\ \text{Tot.} &= 40,178.57 \end{aligned}$$

40.18 kJ

The Dam is 14m high and the water is 14°C. Each particle of water has an internal energy store of 134.5pJ and oscillates at a frequency of 13GHz. Calculate the mass of the water flowing through the dam.

$$\begin{aligned} \Delta h &= 14\text{m} \\ m &= m \\ g &= 10\text{N/kg} \\ \text{GPE} &= 40.18\text{kJ} = 40,180\text{J} \end{aligned}$$

$$\begin{aligned} \text{GPE} &= m \times g \times \Delta h \\ \text{GPE} / (g \times \Delta h) &= m \\ 40,180 / (10 \times 14) &= m \\ 287\text{Kg} &= m \end{aligned}$$

287 kg

Calculate the velocity of the water through the HEP stations.

$$\begin{aligned} m &= 287\text{Kg} \\ \text{KE} &= 40.18\text{kJ} = 40,180\text{J} \\ v &= v \end{aligned}$$

$$\begin{aligned} \text{KE} &= 0.5 \times m \times v^2 \\ v &= \sqrt{(\text{KE} / 0.5 \times m)} \\ v &= \sqrt{(40,180 / 0.5 \times 287)} \\ v &= 16.73\text{m/s} \end{aligned}$$

16.73 m/s

State whether these are series or parallel circuits. Explain your answer.

A: The power pack is set at 12V. There are two bulbs and 2 ammeters. One bulb has a voltage of 3V and a current of 1.2A.

*The bulb has less voltage than total voltage
Must be in series because in parallel both bulbs
would have 12V*

B: The total voltage of this circuit is 9V and the total current is 3A. One bulb, when measured with an ohmmeter has a resistance of 2Ω. There are no smaller resistors than this one.

Resistance = voltage / current

Resistance = 9V / 3A

Resistance = 3Ω

Total resistance is more than 2Ω so must be in series.

C: The voltage over a bulb is 6V and the resistance is 0.51A. the voltage of an immersion heater is 14V and the resistance is 1.19Ω.

Bulb

V / R = I

6V / 0.51Ω = I

11.76A = I

Heater

V / R = I

14V / 1.19Ω = I

11.76A = I

*Must be in series
as the current is
the same.*

An old generator produces 21Kj/min of useful energy with every litre of fuel used. Each litre of diesel contains 15,757J of chemical energy. What is the efficiency when the generator is filled with 3.3L of fuel and runs out in 2.5 mins ?

P = 21kJ / min = 0.35kW = 350W per litre

3.3L fuel = 51,998.1Kj / 2.5mins = 346, 653.3W

Use. = 350W

Tot. = 346,653.3W

Eff. = Eff.

Eff. = Use. / Tot.

Eff. = 350 / 346, 653.3

Eff. = 0.001

0.1 %

After lubrication with 3.5% m/vmmol silica lubricant, it is no 20% efficient. Calculate the useful energy output.

Eff. = 0.2

Use. = Use.

Tot. = 346, 653.3W

Eff. = Use. / Tot.

Use. = Tot. x Eff.

Use. = 346, 653.3 x 0.2

Use. = 69, 330W

69, 330 Js

A rocket is launched at 450m/s. The mass of the booster is 8 tonnes and the mass of the probe is 2.7 tonnes. How high did the rocket reach?

$$v = 450 \text{ m/s}$$

$$m = 8\text{T} + 2.7\text{T} = 10.7\text{T} = 10,700\text{Kg}$$

$$\Delta h = \Delta h$$

$$KE = 0.5 \times m \times v^2$$

$$KE = 0.5 \times 10,700 \times 450^2$$

$$KE = 1,083,375,000\text{J}$$

$$GPE = m \times g \times \Delta h$$

$$KE = m \times g \times \Delta h$$

$$KE / (m \times g) = \Delta h$$

$$1,083,375,000 / (10,700 \times 10) = \Delta h$$

$$10,125\text{m} = \Delta h$$

10.125 km

What velocity would the rocket have to reach to achieve low earth orbit at 114km

$$v = 450 \text{ m/s}$$

$$m = 10,700\text{Kg}$$

$$g = 10\text{N/Kg}$$

$$\Delta h = 114\text{Km} = 114,000\text{m}$$

$$GPE = KE$$

$$m \times g \times \Delta h = 0.5 \times m \times v^2$$

$$\sqrt{\frac{m \times g \times \Delta h}{0.5 \times m}} = v$$

$$\sqrt{\frac{10,700 \times 10 \times 114,000}{0.5 \times 10,700}} = v$$

$$1,509.96 \text{ m/s} = v$$

1,510 m/s

Mr Hewitt lifts a box of glue to a shelf. The box is 8.6kg and the shelf is 1.6m high. How much energy was transferred in the process?

$$m = 8.6 \text{ Kg}$$

$$d = 1.6 \text{ m}$$

$$E = ?$$

$$F = 83.2 \text{ N}$$

$$W = m \times g$$

$$W = 83.2 \text{ N}$$

$$E = F \times d$$

$$E = 83.2 \times 1.6$$

$$E = 133.12 \text{ J}$$

133.12 J

This proved too much, and Mr Hewitt hurt his back. He rigged a motor to the mains electricity and included a 3A fuse for safety. What would be the minimum time that the motor would need to lift the box.

$$V = 230 \text{ V}$$

$$I = 3 \text{ A}$$

$$E = 133.12 \text{ J}$$

$$t = ?$$

$$E = V \times I \times t$$

$$E / (V \times I) = t$$

$$133.12 / (230 \times 3) = t$$

$$0.194 \text{ s} = t$$

0.194 s

The efficiency of the motor is only 5%. How long would it actually take to lift the box?

$$\text{Eff.} = 0.05$$

$$\text{Use.} = 133.12 \text{ J}$$

$$\text{Tot.} = ?$$

$$V = 230 \text{ V}$$

$$I = 3 \text{ A}$$

$$\text{Eff.} = \text{Use.} / \text{Tot.}$$

$$\text{Tot.} = \text{Use.} / \text{Eff.}$$

$$\text{Tot.} = 133.12 / 0.05$$

$$\text{Tot.} = 2662.4 \text{ J}$$

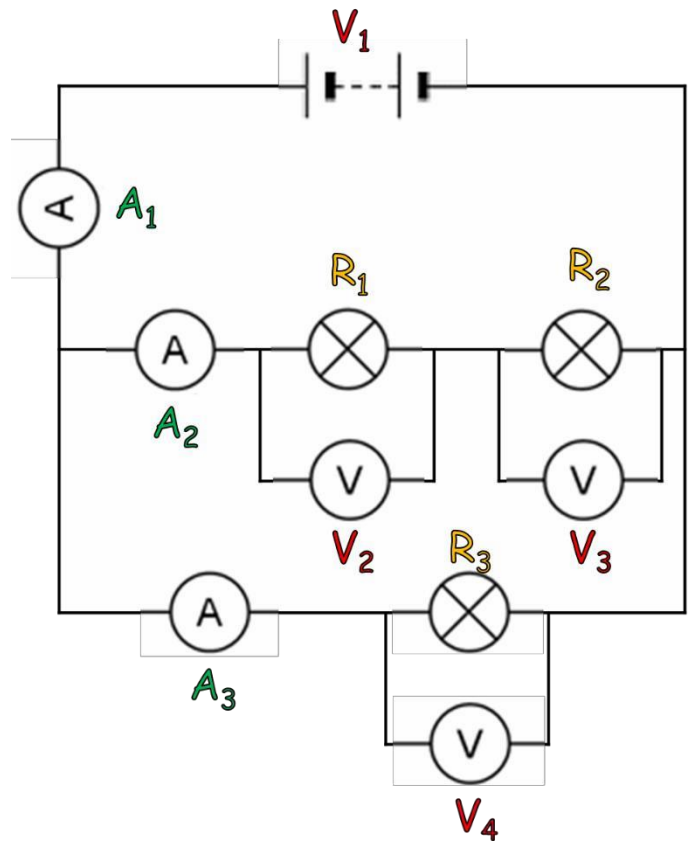

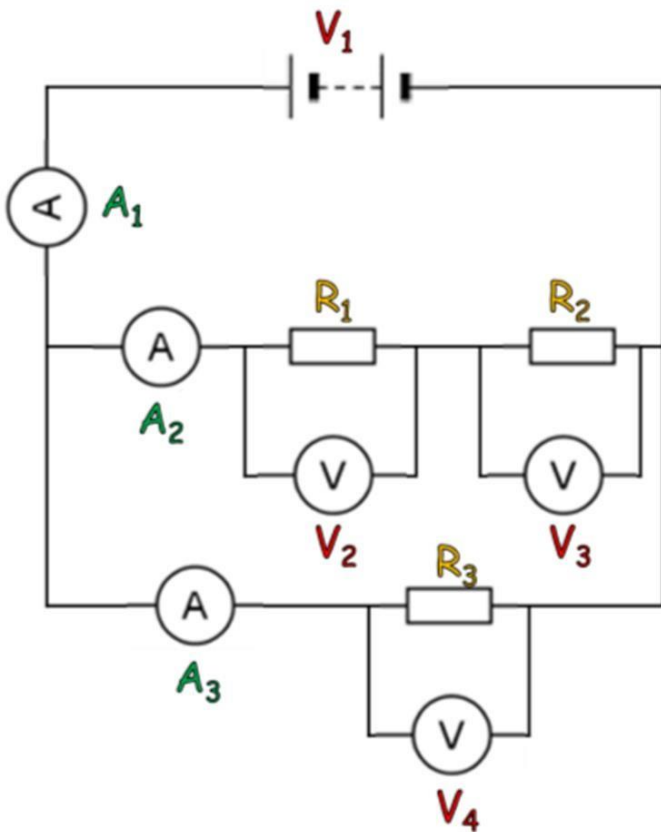

$$E = V \times I \times t$$

$$E / (V \times I) = t$$

$$2662.4 / (230 \times 3) = t$$

$$3.84 \text{ s} = t$$

3.84 s

The power pack gives 12V to the circuit.

The resistor R_3 has a rating of 10Ω . Calculate the current in A_3 .

$$V = 12V$$

$$I = I$$

$$R = 10\Omega$$

$$V = I \times R$$

$$I = V / R$$

$$I = 12 / 10$$

$$I = 1.2A \quad \underline{1.2A}$$

The current shown in A_1 is 2.5A. Calculate the current in A_2 .

$$I_{TOT} = I_1 + I_2$$

$$I_{TOT} = 2.5A$$

$$I_1 = I$$

$$I_2 = 1.3A$$

$$\underline{1.3A}$$

V_2 shows a rating of 5V. Calculate the value of R_1 .

$$V = 5V$$

$$I = 1.3A$$

$$R = R$$

$$V = I \times R$$

$$V / I = R$$

$$5 / 1.3 = R$$

$$3.85\Omega = R \quad \underline{3.85\Omega}$$

Calculate the value of R_2 .

$$V_{TOT} = V_1 + V_2$$

$$V_{TOT} = 12V$$

$$V_1 = 5V$$

$$V_2 = 7V$$

$$V = 7V$$

$$I = 1.3A$$

$$R = R$$

$$V = I \times R$$

$$V / I = R$$

$$7 / 1.3 = R$$

$$5.38\Omega = R \quad \underline{5.38\Omega}$$

Calculate the resistance in the whole circuit.

$$\begin{aligned}V &= 12V \\ I &= 2.5A \\ R &= R\end{aligned}$$

$$\begin{aligned}V &= I \times R \\ V / I &= R \\ 12 / 2.5 &= R \\ 4.8\Omega &= R\end{aligned}$$

$$\underline{4.8\Omega}$$

Show the potential difference of the complete circuit is 12V.

$$\begin{aligned}V &= V \\ I &= 2.5A \\ R &= 4.8\Omega\end{aligned}$$

$$\begin{aligned}V &= I \times R \\ V &= 2.5 \times 4.8 \\ V &= 12V\end{aligned}$$

$$\underline{12V}_V$$

Explain why the resistance of the circuit is less than 10Ω.

The potential difference is the same across the resistors but in parallel the current has more than one route this increases the total current around the loop which decreases the resistance using $V=IR$

Calculate the power transferred in the circuit using the voltage and current in the circuit.

$$\begin{aligned}P &= P \\ I &= 2.5A \\ V &= 12V\end{aligned}$$

$$\begin{aligned}P &= I \times V \\ V &= 2.5 \times 4.8 \\ V &= 12V\end{aligned}$$

$$\underline{12V}_W$$

Using the power rating, show the total resistance of the circuit is less than 10Ω.

$$\underline{\hspace{2cm}}_W$$

The Power of the circuit decreased by 50% when the filament lamps were added. Calculate the new current at A₁.

$$\underline{\hspace{2cm}}_A$$

Calculate the current at A₂.

$$\underline{\hspace{2cm}}_A$$

V_2 shows a rating of 4V, calculate the resistance in R_1 .

_____ Ω

Calculate the resistance of the filament lamp in R_2 .

_____ Ω

Explain why the resistance of the filament lamps has increased.

Using the equation $P=I^2R$, calculate the resistance of the complete circuit.

_____ Ω

Using the rules of resistance in series and parallel circuits, confirm this calculation is correct.

The dancing minion has a power rating of 6W.

Calculate the amount of energy transferred in 2 minutes of dancing.

_____ J

The minion is powered by a 2V button battery, calculate the current.

_____ A

What is the energy transferred if the minion dances for 6 minutes?

_____J

After 6 minutes the chemical store of the battery has reduced, the current is now 2A, calculate the charge flowing in the circuit.

_____C

The new voltage is 1.5V. Calculate the energy transferred in the 6 minutes.

_____J

Calculate the resistance in the circuit after the battery depleted.

_____Ω

The dancing minion is replaced with a new 2V battery. The power rating is now 8W. Calculate the time taken to transfer 1000J of energy if the charge is 20C.

_____J
